

AKVA ALLROUND 2016

- Assemble the base. (See also assembly instructions for Akva bases.)
- The bottom plates are placed on the base and joined with the 4 legged plates. The side of the bottom plates that should be turning up is the one with the threaded bushings – like shown on these pictures.

- The angle brackets are positioned at the sides and the ends. They are only to be tightened loosely at this point.

- The Allround wooden frame is to be placed on the bed in such a way that the angle brackets shown above will slide into the cavity of the wooden frame.

- The angle brackets are tightened loosely at the corners. Then one by one the screws at each corner are tightened firmly. It is important to begin with the inner screws.

- The angle brackets in the middle are pulled towards the center of the bed and fastened.

- The lower part of the cover is positioned with the AKVA logo at the foot end. The top cover is zipped off and put aside. The fixing paddles are put through the holes in the lower part of the cover and fixed to the bottom plates.
- At first the long sides of the foam frame are placed in the cover, then the head and food end parts.

- The heater(s) is positioned, and the wire is led under the foam frame and through the hole in the lower part of the cover. (See assembly instructions Akva Vital Electronics heater before installing the heater.)
- The safety liner is placed in the bed.
- If this is a bed with a dual mattress system the divider is now placed in the middle.
- The water mattress(es) is placed in the safety liner. (See instructions for water mattresses.)
- After filling the mattress, removing the surplus of air and adding one or two bottles of Long Life the top cover is zipped on the lower part of the cover. (See instructions for covers.)
